EXAMINER

SHAPIRO, LEONID

ART UNIT

PAPER NUMBER

2677

DATE MAILED: 11/16/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No. 10/604,822	Applicant(s) HSU, HORNG-BIN	
	Examiner Leonid Shapiro	Art Unit 2673	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 20 August 2003.
- 2a) ☐ This action is FINAL. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-11 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-11 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 20 August 2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

1. Claims 1-2, 4 are rejected under 35 U.S.C. 103(a) as being unpatentable over Asao et al. (US Patent No. 6,809,717 B2) in view of Watanabe (JP 11-109317).

As to claim 1, Asao et al. teaches a driving method of a Liquid Crystal Display (LCD) (See Col. 1, Lines 7-12), the liquid crystal display comprising a back-light module (See Fig. 19, item 101) and a liquid crystal display panel (See Fig. 19, item 80), wherein the liquid has a plurality of pixels (See Col. 1, Lines 13-15), the driving method of the liquid crystal display comprising the steps of:

adjusting brightness of the back-light module (See Fig. 21, items Light Source, R1-R2, Col. 8, Lines 15-42 and 1-2), and

adjusting a grayscale value X_a of each pixel to a mapping grayscale value X_b , and driving each of the pixels with the grayscale value X_b accordingly (See Fig. 21, items 1st Line, $T_x(R)$, , $T_y(R)$, Col. 7, Lines 43-46 and from Col. 8, Line 43 to Col. 9, Line 42).

Asao et al. does not disclose

detecting the maximum grayscale X of all pixels in the present image;

Art Unit: 2673

adjusting brightness of the back-light module to $(X / N) \times L$, where N is the highest grayscale of the image display system, and L is a corresponding brightness to the grayscale value N of the back-light module.

Watanabe teaches

detecting the maximum grayscale X of all pixels in the present image (See Figure, item 7, Solution);

adjusting brightness of the back-light module to $(X / N) \times L$, where N is the highest grayscale of the image display system, and L is a corresponding brightness to the grayscale value N of the back-light module in the reference $L = 100$, $X = 30$, $N = 100$, so $(X / N) \times L = 30\%$ (See Solution).

It would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate teaching of Watanabe into Asao et al. system in order to maximize contrast and reduce power consumption (See Problem To Be Solved in the Watanabe reference).

As to claim 2 Asao et al. teaches a mapping correlation between the grayscale value X_a (in the reference is equivalent to the higher (first) luminance) and the grayscale value X_b (in the reference is equivalent to the lower (second) luminance) is linear (in the reference is equivalent to 1/5) and the correlation is performed as $X_b = (X_a / X) \times N$ (in the reference is equivalent to 1/5) (See Fig. 21, items 1st Line, $T_x(R)$, $T_y(R)$, Col. 7, Lines 43-46 and from Col. 8, Line 43 to Col. 9, Line 42).

As to claim 4 Asao et al. teaches light transmittance of each of the pixels is adjusted by a bias voltage based on the grayscale value (See Fig. 14, item Vpix, Col. 26, Lines 33-38).

2. Claim 3 is rejected under 35 U.S.C. 103(a) as being unpatentable over Asao et al. and Watanabe as applied to claim 1 above, and further in view of Kori et al. (Pub. No.: US 2004/0071363 A1).

Asao et al. and Watanabe do not disclose a mapping correlation between the grayscale value Xa and the grayscale value Xb is nonlinear.

Kouri et al. teaches a mapping correlation between the grayscale value Xa and the grayscale value Xb is nonlinear (See paragraph 0786).

It would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate teaching of Kouri et al. into Watanabe and Asao et al. system in order to improve signal (See paragraph 0007 in the Kouri et al. reference).

3. Claims 5-6, 8-11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Asao et al. in view of Watanabe and Lin (US Patent No. 6,674,914 B1).

As to claim 5, Asao et al. teaches a driving method of a Liquid Crystal Display (LCD) (See Col. 1, Lines 7-12), the liquid crystal display comprising a back-light module (See Fig. 19, item 101) and a liquid crystal display panel (See Fig. 19, item 80), wherein the liquid has a plurality of pixels (See Col. 1, Lines 13-15), the driving method of the liquid crystal display comprising the steps

Art Unit: 2673

of:

adjusting brightness of the back-light module (See Fig. 21, items Light Source, R1-R2, Col. 8, Lines 15-42 and 1-2), and

adjusting a grayscale value X_a of each pixel to a mapping grayscale value X_b , and driving each of the pixels with the grayscale value X_b accordingly (See Fig. 21, items 1st Line, $T_x(R)$, , $T_y(R)$, Col. 7, Lines 43-46 and from Col. 8, Line 43 to Col. 9, Line 42).

Asao et al. does not disclose

detecting the maximum grayscale X of all pixels in the present image;

adjusting brightness of the back-light module to $(Y / N) \times L$, where N is the highest grayscale of the image display system, and L is a corresponding brightness to the grayscale value N of the back-light module.

Watanabe teaches

detecting the maximum grayscale X of all pixels in the present image (See Figure, item 7, Solution);

adjusting brightness of the back-light module to $(Y / N) \times L$, where N is the highest grayscale of the image display system, and L is a corresponding brightness to the grayscale value N of the back-light module in the reference $L = 100$, $Y = 30$, $N = 100$, so $(Y / N) \times L = 30\%$ (See Solution).

It would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate teaching of Watanabe into Asao et al. system in order to

Art Unit: 2673

maximize contrast and reduce power consumption (See Problem To Be Solved in the Watanabe reference).

Asao et al. and Watanabe do not disclose dividing a plurality of grayscale values $0, 1, 2, \dots, N$ into a plurality of segments, where n is the highest grayscale of the image display system.

Lin teaches dividing a plurality of grayscale values $0, 1, 2, \dots, N$ into a plurality of segments, where n is the highest grayscale of the image display system (See Fig. 2A, items k00-k20, location 3-5, Col. 4, Lines 47-65).

It would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate teaching of Lin into Watanabe and Asao et al. system in order to improve image processing (See Col. 1, Lines 6-9) in the Lin reference).

As to claim 6 Asao et al. teaches a mapping correlation between the grayscale value X_a (in the reference is equivalent to the higher (first) luminance) and the grayscale value X_b (in the reference is equivalent to the lower (second) luminance) is linear (in the reference is equivalent to $1/5$) and the correlation is performed as $X_b = (X_a/X) \times N$ (in the reference is equivalent to $1/5$) (See Fig. 21, items 1st Line, $T_x(R)$, $T_y(R)$, Col. 7, Lines 43-46 and from Col. 8, Line 43 to Col. 9, Line 42).

As to claim 8, Lin teaches the corresponding output brightness is retained when the grayscale maximum X is located in either a range between $Z+S$ and Z of a present image, where Z is lower limit of one of the segments (in the reference minimum value of pixels generated at that location) (See Fig. 2A, items k00-k20, location 3-5, Col. 4, Lines 47-65).

Art Unit: 2673

As to claim 9, Lin teaches each of segments contains the same number of the gray scale values (in reference locations 2 and 3 have the same grayscale value 2) (See Fig. 2A, items k00-k20, location 3-5, Col. 4, Lines 47-65).

As to claim 10, Lin teaches each of segments contains different number of the gray scale values respectively (in reference locations 3 and 4 have respectively grayscale values 2 and 3) (See Fig. 2A, items k00-k20, location 3-5, Col. 4, Lines 47-65).

As to claims 11 Asao et al. teaches light transmittance of each of the pixels is adjusted by a bias voltage based on the grayscale value (See Fig. 14, item Vpix, Col. 26, Lines 33-38).

4. Claim 7 is rejected under 35 U.S.C. 103(a) as being unpatentable over Asao et al., Lin and Watanabe as applied to claim 5 above, and further in view of Kori et al.

Asao et al. and Watanabe do not disclose a mapping correlation between the grayscale value Xa and the grayscale value Xb is nonlinear.

Kouri et al. teaches a mapping correlation between the grayscale value Xa and the grayscale value Xb is nonlinear (See paragraph 0786).

It would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate teaching of Kouri et al. into Watanabe and Asao et al. system in order to improve signal (See paragraph 0007 in the Kouri et al. reference).

Telephone Inquire

Art Unit: 2673

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Leonid Shapiro whose telephone number is 571-272-7683. The examiner can normally be reached on 8 a.m. to 5 p.m..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Amr Awad can be reached on 571-272-7764. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
